

Chapter 1. Overview and Descriptive Statistics

Math 3670 Spring 2025

Georgia Institute of Technology

Section 1.
Populations, Samples, and Processes

Population and Sample

Population: A well-defined collection of objects.

Ex: All individuals who received a B.S. in engineering during the most recent academic year

Sample: A subset of the population selected in a prescribed way.

Ex: Select a sample of last year's engineering graduates to obtain feedback about the quality of the engineering curricula

Variable: Any characteristic whose value may change from one object to another in the population

Ex: Brand of calculator owned by a student

Univariate, Bivariate, Multivariate Data

Descriptive Statistics

To summarize and describe important features of the data

1. Graphical methods: Boxplots, Histograms, Scatter plots, etc.
2. Numerical methods: means, standard deviations, correlation coefficients, etc.

Example

Charity is a big business in the United States. The Web site charitynavigator.com gives information on roughly 5500 charitable organizations, and there are many smaller charities that fly below the navigator's radar screen. Some charities operate very efficiently, with fundraising and administrative expenses that are only a small percentage of total expenses, whereas others spend a high percentage of what they take in on such activities. Here is data on fundraising expenses as a percentage of total expenditures for a random sample of 60 charities:

6.1	12.6	34.7	1.6	18.8	2.2	3.0	2.2	5.6	3.8
2.2	3.1	1.3	1.1	14.1	4.0	21.0	6.1	1.3	20.4

Overview

Section 2. Pictorial and Tabular Methods in Descriptive Statistics

Stem-and-Leaf Displays

Consider a numerical data set x_1, x_2, \dots, x_n for which each x_i consists of at least two digits.

How to construct Stem-and-Leaf Displays

1. Select one or more leading digits for the stem values. The trailing digits become the leaves.
2. List possible stem values in a vertical column.
3. Record the leaf for each observation beside the corresponding stem value.
4. Indicate the units for stems and leaves someplace in the display.

Stem-and-Leaf Displays

Example

0	4	
1	1345678889	
2	1223456666777889999	
3	011223334455566667777888899999	Stem: tens digit Leaf: ones digit
4	111222223344445566666677788888999	
5	00111222233455666667777888899	
6	01111244455666778	

Figure 1.4 Stem-and-leaf display for the percentage of binge drinkers at each of the 140 colleges

Stem-and-Leaf Displays

Information from Stem-and-Leaf Displays

1. identification of a typical or representative value
2. extent of spread about the typical value
3. presence of any gaps in the data
4. extent of symmetry in the distribution of values
5. number and location of peaks
6. presence of any outlying values

Dotplots

10.8	6.9	8.0	8.8	7.3	3.6	4.1	6.0	4.4	8.3
8.1	8.0	5.9	5.9	7.6	8.9	8.5	8.1	4.2	5.7

7.4	7.5	8.4	8.3	2.6	5.1	6.0	7.0	6.5	10.3

Histograms

Definitions

A numerical variable is **discrete** if its set of possible values either is finite or else can be listed in an infinite sequence (one in which there is a first number, a second number, and so on).

A numerical variable is **continuous** if its possible values consist of an entire interval on the number line.

Histograms

Example (Discrete Data)

Hits/Game	Number of Games	Relative Frequency	Hits/Game	Number of Games	Relative Frequency

Section 3. Measures of Locations

The Mean

Definition

Consider a data set x_1, x_2, \dots, x_n .

The **sample mean** is defined by

$$\bar{x} = \frac{x_1 + x_2 + \dots + x_n}{n} = \frac{1}{n} \sum_{i=1}^n x_i.$$

Example

Example

People not familiar with classical music might tend to believe that a composer's instructions for playing a particular piece are so specific that the duration would not depend at all on the performer(s).

However, there is typically plenty of room for interpretation, and orchestral conductors and musicians take full advantage of this.

Selected a sample of 12 recordings of Beethoven's Symphony #9 yielding the following durations (min) listed in increasing order:

62.3, 62.8, 63.6, 65.2, 65.7, 66.4, 67.4, 68.4, 68.8, 70.8, 75.7, 79.0

The sample mean is $\bar{x} = 816.1/12 = 68.01$.

The Median

Definition

The **sample median** is obtained by first ordering the n observations from smallest to largest.

If the number of the observation is even,

If the number of the observation is odd,

Example

Example

People not familiar with classical music might tend to believe that a composer's instructions for playing a particular piece are so specific that the duration would not depend at all on the performer(s).

However, there is typically plenty of room for interpretation, and orchestral conductors and musicians take full advantage of this.

Selected a sample of 12 recordings of Beethoven's Symphony #9 yielding the following durations (min) listed in increasing order:

62.3, 62.8, 63.6, 65.2, 65.7, 66.4, 67.4, 68.4, 68.8, 70.8, 75.7, 79.0

The sample median \tilde{x} is

Population Mean and Median

Definition

The **population mean** is

$$\mu =$$

The **population median** $\tilde{\mu}$ is the median from the whole population.

(a) Negative skew

(b) Symmetric

(c) Positive skew

Quartiles and Percentiles

Definition

Quartiles: divide the number of data points into four equal parts.

Percentiles: divide the number of data points into 100 equal parts.

Example

62.3, 62.8, 63.6, 65.2, 65.7, 66.4, 67.4, 68.4, 68.8, 70.8, 75.7, 79.0

Trimmed Means

Definition

A **trimmed mean** a trimming percentage of $\alpha\%$ is the mean of the data set after removing the smallest $\alpha\%$ and the largest $\alpha\%$.

Example

62.3, 62.8, 63.6, 65.2, 65.7, 66.4, 67.4, 68.4, 68.8, 70.8, 75.7, 79.0

Exercise

The May 1, 2009 issue of The Montclarian reported the following home sale amounts for a sample of homes in Alameda, CA that were sold the previous month (1000s of \$):

590, 815, 575, 608, 350, 1285, 408, 540, 555, 679.

The sum is 6405.

1. Calculate and interpret the sample mean and median.
2. Suppose the 6th observation had been 985 rather than 1285. How would the mean and median change?
3. Calculate a 10% trimmed mean.

Section 4. Measures of Variability

The Sample Variance

Example

Consider the two data sets

Data 1: 10, 20, 30, 40, 50, 60, 70,
Data 2: 30, 35, 37, 40, 43, 45, 50.

The Sample Variance

Definition

The **sample variance** is defined by

$$s^2 = \frac{S_{xx}}{n - 1} =$$

The **sample standard deviation** is

$$s = \sqrt{s^2}.$$

The Sample Variance

Suppose the population consists of x_1, x_2, \dots, x_N .

Definition

The **population variance** is defined by

$$\sigma^2 = \frac{1}{N} \sum_{i=1}^N (x_i - \mu)^2.$$

Example

Example

Car	x_i	$x_i - \bar{x}$	$(x_i - \bar{x})^2$
1	27.3	-5.96	35.522
2	27.9	-5.36	28.730
3	32.9	-0.36	0.130
4	35.2	1.94	3.764
5	44.9	11.64	135.490
6	39.9	6.64	44.090
7	30.0	-3.26	10.628
8	29.7	-3.56	12.674
9	28.5	-4.76	22.658
10	32.0	-1.26	1.588
11	37.6	4.34	18.836
<hr/>			
	$\sum x_i = 365.9$	$\sum (x_i - \bar{x}) = .04$	$\sum (x_i - \bar{x})^2 = 314.106$
			$\bar{x} = 33.26$

Computing Formula for s^2

Proposition

$$S_{xx} = \sum_{i=1}^n (x_i - \bar{x})^2 =$$

Example

Example

Consider the following data:

2.1389	2.8132	2.4451	2.4660	2.6038	2.4186
3.8592	2.1988	2.3529	2.2028	2.7468	1.5104
2.1987	2.5252	2.8462	2.2722	2.2026	2.0153

Knowing

$$\sum_{i=1}^{18} x_i = 43.8166, \quad \sum_{i=1}^{18} x_i^2 = 110.5081,$$

find the sample mean and variance.

Boxplots

Order the n observations from smallest to largest and separate the smallest half from the largest half.

The median \tilde{x} is included in both halves if n is odd.

Then the lower fourth is the median of the smallest half and the upper fourth is the median of the largest half.

A measure of spread that is resistant to outliers is the **fourth spread** f_s , given by

$$f_s =$$

Example

Example

Consider the data

40	52	55	60	70	75	85	85	90		
90	92	94	94	95	98	100	115	125	125	

Then,

1. The smallest x_i :
2. The lower fourth:
3. The median:
4. The upper fourth:
5. The largest x_i :

Example

Variable	N	Mean	Median	TrMean	StDev	SE Mean
depth	19	86.32	90.00	86.76	23.32	5.35
Variable	Minimum	Maximum	Q1	Q3		
depth	40.00	125.00	70.00	98.00		

Outliers

Definition

Any observation farther than $1.5f_s$ from the closest fourth is an **outlier**.

An outlier is **extreme** if it is more than $3f_s$ from the nearest fourth, and it is **mild** otherwise.

Example

The Clean Water Act and subsequent amendments require that all waters in the United States meet specific pollution reduction goals to ensure that water is “fishable and swimmable.” The article “Spurious Correlation in the USEPA Rating Curve Method for Estimating Pollutant Loads” (*J. of Environ. Engr.*, 2008: 610–618) investigated various techniques for estimating pollutant loads in watersheds; the authors “discuss the imperative need to use sound statistical methods” for this purpose. Among the data considered is the following sample of TN (total nitrogen) loads (kg N/day) from a particular Chesapeake Bay location, displayed here in increasing order.

9.69	13.16	17.09	18.12	23.70	24.07	24.29	26.43
30.75	31.54	35.07	36.99	40.32	42.51	45.64	48.22
49.98	50.06	55.02	57.00	58.41	61.31	64.25	65.24
66.14	67.68	81.40	90.80	92.17	92.42	100.82	101.94
103.61	106.28	106.80	108.69	114.61	120.86	124.54	143.27
143.75	149.64	167.79	182.50	192.55	193.53	271.57	292.61
312.45	352.09	371.47	444.68	460.86	563.92	690.11	826.54
1529.35							

Example

$$\begin{array}{lll} \tilde{x} = 92.17 & \text{lower } 4^{\text{th}} = 45.64 & \text{upper } 4^{\text{th}} = 167.79 \\ f_s = 122.15 & 1.5f_s = 183.225 & 3f_s = 366.45 \end{array}$$

Exercise

The value of Young's modulus (GPa) was determined for cast plates consisting of certain intermetallic substrates, resulting in the following sample observations:

116.4 115.9 114.6 115.2 115.8

1. Calculate \bar{x} and the deviations from the mean.
2. Use the deviations calculated in part (a) to obtain the sample variance and the sample standard deviation.
3. Calculate s^2 by using the computational formula for the numerator S_{xx} .
4. Subtract 100 from each observation to obtain a sample of transformed values. Now calculate the sample variance of these transformed values, and compare it to s^2 for the original data.
