

## Chapter 10 : Finite-State Markov Chains

### 10.2 : The Steady-State Vector and Page Rank

# Topics and Objectives

## Topics

1. Review of Markov chains
2. Theorem describing the steady state of a Markov chain
3. Applying Markov chains to model website usage.
4. Calculating the PageRank of a web.

## Learning Objectives

1. Determine whether a stochastic matrix is regular.
2. Apply matrix powers and theorems to characterize the long-term behaviour of a Markov chain.
3. Construct a transition matrix, a Markov Chain, and a Google Matrix for a given web, and compute the PageRank of the web.

## Where is Chapter 10?

- The material for this part of the course is covered in Section 10.2
- Chapter 10 is not included in the **print** version of the book, but it is in the **on-line version**.
- If you read 10.2, and I recommend that you do, you will find that it requires an understanding of 10.1.
- You are not required to understand the material in 10.1.

# Steady State Vectors

Recall the car rental problem from our Section 4.9 lecture.

## Problem

A car rental company has 3 rental locations, A, B, and C.

		rented from		
		A	B	C
returned to	A	.8	.1	.2
	B	.2	.6	.3
	C	.0	.3	.5

There are 10 cars at each location today, what happens to the distribution of cars **after a long time?**

$\vec{x}_n$  when  $n$  is large

$$P = \begin{matrix} \begin{matrix} \text{From} \\ \underline{A} & \underline{B} & \underline{C} \end{matrix} \\ \begin{bmatrix} 0.8 & 0.1 & 0.2 \\ 0.2 & 0.6 & 0.3 \\ 0 & 0.3 & 0.5 \end{bmatrix} \end{matrix} \begin{matrix} \underline{A} \\ \underline{B} \\ \underline{C} \end{matrix}$$

$$\vec{x}_0 = \begin{bmatrix} 10 \\ 10 \\ 10 \end{bmatrix}$$

1 period

$$\vec{x}_1 = \begin{bmatrix} a \\ b \\ c \end{bmatrix} = P \cdot \vec{x}_0$$

$$Q: \lim_{n \rightarrow \infty} \vec{x}_n = ?$$

## Long Term Behaviour

Can use the transition matrix,  $P$ , to find the distribution of cars after 1 week:

$$\vec{x}_1 = P\vec{x}_0$$

The distribution of cars after 2 weeks is:

$$\vec{x}_2 = P\vec{x}_1 = PP\vec{x}_0 = P^2 \cdot \vec{x}_0$$

The distribution of cars after  $n$  weeks is:

$$\vec{x}_n = P^n \cdot \vec{x}_0$$

## Long Term Behaviour

To investigate the long-term behaviour of a system that has a regular transition matrix  $P$ , we could:

1. compute the **steady-state vector**,  $\vec{q}$ , by solving  $\vec{q} = P\vec{q}$ .  
*prob. vector*  $\vec{q}$  is an eigenvector for  $\lambda = 1$
2. compute  $P^n \vec{x}_0$  for large  $n$ .
3. compute  $P^n$  for large  $n$ , each column of the resulting matrix is the steady-state

Definition  $P$  is regular if  $P^k$  has no zero entries for some  $k$ .

## Theorem 1

If  $P$  is a regular  $m \times m$  transition matrix with  $m \geq 2$ , then the following statements are all true.

a matrix whose columns are probability vectors  
 $\nwarrow$  stochastic matrix

1. There is a stochastic matrix  $\Pi$  such that

$$\lim_{n \rightarrow \infty} P^n = \Pi = \begin{bmatrix} \vec{q} & \vec{q} & \dots & \vec{q} \end{bmatrix}$$

2. Each column of  $\Pi$  is the same probability vector  $\vec{q}$ .

3. For any initial probability vector  $\vec{x}_0$ ,  $\begin{bmatrix} \frac{1}{3} \\ \frac{1}{3} \\ \frac{1}{3} \end{bmatrix}, \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} \frac{1}{2} \\ \frac{1}{2} \\ 0 \end{bmatrix} = \vec{x}_0$

$$\lim_{n \rightarrow \infty} P^n \vec{x}_0 = \vec{q}$$

does not depend on  $\vec{x}_0$

4.  $P$  has a unique eigenvector,  $\vec{q}$ , which has eigenvalue  $\lambda = 1$ . steady-state prob. vector
5. The eigenvalues of  $P$  satisfy  $|\lambda| \leq 1$ .

We will apply this theorem when solving PageRank problems.

## Example 1

A set of web pages link to each other according to this diagram.

Page A has links to pages B, D.

Page B has links to pages A, C, D.

We make two assumptions:

- A user on a page in this web is equally likely to go to any of the pages that their page links to.
- If a user is on a page that does not link to other pages, the user stays at that page.

Use these assumptions to construct a Markov chain that represents how users navigate the above web.

## Solution

Use the assumptions on the previous slide to construct a Markov chain that represents how users navigate the web.

Section 10.2 Slide 9

$$P = \begin{matrix} & \begin{matrix} A & B & C & D & E \end{matrix} \\ \begin{matrix} A \\ B \\ C \\ D \\ E \end{matrix} & \begin{bmatrix} 0 & \frac{1}{3} & 1 & 0 & 0 \\ \frac{1}{2} & 0 & 0 & 0 & 0 \\ 0 & \frac{1}{3} & 0 & 0 & 0 \\ \frac{1}{2} & \frac{1}{3} & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 1 \end{bmatrix} \end{matrix}$$

← Not Regular.

## Transition Matrix, Importance, and PageRank

- The square matrix we constructed in the previous example is a **transition matrix**. It describes how users transition between pages in the web.
- The **steady-state vector**,  $\vec{q}$ , for the Markov-chain, can characterize the long-term behavior of users in a given web.
- If  $\vec{q}$  is unique, the **importance** of a page in a web is given by its corresponding entry in  $\vec{q}$ .
- The **PageRank** is the ranking assigned to each page based on its importance. The highest ranked page has PageRank 1, the second PageRank 2, and so on.
- Two pages with same importance receive the same PageRank (some other method would be needed to resolve ties)

Is the transition matrix in Example 1 a regular matrix?

## Adjustment 1

for unique steady-state vector.

### Adjustment 1

like  $\textcircled{E}$ .

If a user reaches a page that does not link to other pages, the user will choose any page in the web, with equal probability, and move to that page.

Let's denote this modified transition matrix as  $P_*$ . Our transition matrix in Example 1 becomes:

$$P = \begin{bmatrix} 0 & \frac{1}{3} & 1 & 0 & 0 \\ \frac{1}{2} & 0 & 0 & 0 & 0 \\ 0 & \frac{1}{3} & 0 & 0 & 0 \\ \frac{1}{2} & \frac{1}{3} & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 1 \end{bmatrix}$$

$$P_* = \begin{bmatrix} 0 & \frac{1}{3} & 1 & 0 & \frac{1}{5} \\ \frac{1}{2} & 0 & 0 & 0 & \frac{1}{5} \\ 0 & \frac{1}{3} & 0 & 0 & \frac{1}{5} \\ \frac{1}{2} & \frac{1}{3} & 0 & 0 & \frac{1}{5} \\ 0 & 0 & 0 & 1 & \frac{1}{5} \end{bmatrix}$$

↑  
regular.

Q: Find  $\vec{q}$

$$P\vec{q} = \vec{q}$$

$$(P - I) \cdot \vec{q} = \vec{0}.$$

## Adjustment 2

### Adjustment 2

A user at any page will navigate to any page among those that their page links to with equal probability  $p$ , and to any page in the web with equal probability  $1 - p$ . The transition matrix becomes

$$G = pP_* + (1 - p)K$$

All the elements of the  $n \times n$  matrix  $K$  are equal to  $1/n$ .

$p$  is referred to as the **damping factor**, Google is said to use  $p = 0.85$ .

With adjustments 1 and 2, our the Google matrix is:

$$G = p \cdot \begin{bmatrix} 0 & \frac{1}{3} & 1 & 0 & \frac{1}{5} \\ \frac{1}{2} & 0 & 0 & 0 & \frac{1}{5} \\ 0 & \frac{1}{3} & 0 & 0 & \frac{1}{5} \\ \frac{1}{2} & \frac{1}{3} & 0 & 0 & \frac{1}{5} \\ 0 & 0 & 0 & 1 & \frac{1}{5} \end{bmatrix} + (1-p) \cdot \begin{bmatrix} \frac{1}{5} & \frac{1}{5} & \frac{1}{5} & \frac{1}{5} & \frac{1}{5} \\ \frac{1}{5} & \frac{1}{5} & \frac{1}{5} & \frac{1}{5} & \frac{1}{5} \\ \frac{1}{5} & \frac{1}{5} & \frac{1}{5} & \frac{1}{5} & \frac{1}{5} \\ \frac{1}{5} & \frac{1}{5} & \frac{1}{5} & \frac{1}{5} & \frac{1}{5} \\ \frac{1}{5} & \frac{1}{5} & \frac{1}{5} & \frac{1}{5} & \frac{1}{5} \end{bmatrix}$$

## Computing Page Rank

- Because  $G$  is stochastic, for any initial probability vector  $\vec{x}_0$ ,

$$\lim_{n \rightarrow \infty} G^n \vec{x}_0 = \vec{q}$$

- We can obtain steady-state evaluating  $G^n \vec{x}_0$  for large  $n$ , by solving  $G\vec{q} = \vec{q}$ , or by evaluating  $\vec{x}_n = G\vec{x}_{n-1}$  for large  $n$ .
- Elements of the steady-state vector give the importance of each page in the web, which can be used to determine PageRank.
- Largest element in steady-state vector corresponds to page with PageRank 1, second largest with PageRank 2, and so on.

On an exam,

- problems that require a calculator will not be on your exam
- you may construct your  $G$  matrix using fractions instead of decimal expansions

SS  
top

$P^*$

Page Rank 1 = B.

Page Rank 2 = A

$\vdots$

Page Rank 5 = E

## There is (of course) Much More to PageRank

The PageRank Algorithm currently used by Google is under constant development, and tailored to individual users.

- When PageRank was devised, in 1996, Yahoo! used humans to provide a "index for the Internet," which was 10 million pages.
- The PageRank algorithm was produced as a competing method. The patent was awarded to Stanford University, and exclusively licensed to the newly formed Google corporation.
- Brin and Page combined the PageRank algorithm with a webcrawler to provide regular updates to the transition matrix for the web.
- The explosive growth of the web soon overwhelmed human based approaches to searching the internet.

## WolframAlpha and MATLAB/Octave Syntax

Suppose we want to compute

$$\begin{pmatrix} .8 & .1 & .2 \\ .2 & .6 & .3 \\ .0 & .3 & .5 \end{pmatrix}^{10}$$

- At wolframalpha.com, we can use the syntax:

```
MatrixPower[{{.8,.1,.2},{.2,.6,.3},{.0,.3,.5}},10]
```

- In MATLAB, we can use the syntax

```
[.8 .1 .2 ; .2 .6 .3 ; .0 .3 .5]^10
```

- Octave uses the same syntax as MATLAB, and there are several free, online, Octave compilers. For example: <https://octave-online.net>.

You will need to compute a few matrix powers in your homework, and in your future courses, depending on what courses you end up taking.

## Example 2 (if time permits)

Construct the Google Matrix for the web below. Which page do you think will have the highest PageRank? How would your result depend on the damping factor  $p$ ? Use software to explore these questions.

# Section 7.1 : Diagonalization of Symmetric Matrices

Chapter 7: Orthogonality and Least Squares

Math 1554 Linear Algebra

# Topics and Objectives

## Topics

1. Symmetric matrices
2. Orthogonal diagonalization

## Learning Objectives

1. Construct an orthogonal diagonalization of a symmetric matrix,  
 $A = PDP^T$ .

# Symmetric Matrices

## Definition

Matrix  $A$  is **symmetric** if  $A^T = A$ .

**Example.** Which of the following matrices are symmetric? Symbols  $*$  and  $\star$  represent real numbers.

$$A = [*]_{1 \times 1} = A^T$$

$$B = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$$

$$B^T = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$$

$$C = \begin{bmatrix} 4 & 0 \\ 0 & 0 \end{bmatrix} = \begin{bmatrix} 4 & 0 \\ 0 & 0 \end{bmatrix} = C^T$$

$$D = \begin{bmatrix} 1 & 1 \\ 0 & 0 \end{bmatrix}$$

$$D^T = \begin{bmatrix} 1 & 0 \\ 1 & 0 \end{bmatrix}$$

$$E = \begin{bmatrix} 4 & 2 \\ 0 & 0 \\ 0 & 0 \end{bmatrix}$$

$$E^T = \begin{bmatrix} 4 & 0 & 0 \\ 2 & 0 & 0 \end{bmatrix}$$

$$F = \begin{bmatrix} 4 & 2 & 0 & 1 \\ 2 & 0 & 7 & 4 \\ 0 & 7 & 6 & 0 \\ 1 & 4 & 0 & 3 \end{bmatrix}$$

← Symm? Yes.

## $A^T A$ is Symmetric

A very common example: For **any** matrix  $A$  with columns  $a_1, \dots, a_n$ ,

①

$$A^T A = \begin{bmatrix} \text{---} & a_1^T & \text{---} \\ \text{---} & a_2^T & \text{---} \\ \vdots & \vdots & \vdots \\ \text{---} & a_n^T & \text{---} \end{bmatrix} \begin{bmatrix} | & | & \cdots & | \\ a_1 & a_2 & \cdots & a_n \\ | & | & \cdots & | \end{bmatrix}$$

$$= \begin{bmatrix} a_1^T a_1 & a_1^T a_2 & \cdots & a_1^T a_n \\ a_2^T a_1 & a_2^T a_2 & \cdots & a_2^T a_n \\ \vdots & \vdots & \ddots & \vdots \\ a_n^T a_1 & a_n^T a_2 & \cdots & a_n^T a_n \end{bmatrix}$$

Entries are the dot products of columns of  $A$

$$a_i^T \cdot a_i = a_{1i} \cdot a_{1i}$$

②

$$(A^T \cdot A)^T = A^T \cdot (A^T)^T = A^T \cdot A$$

Recall Two eigenvectors  $\vec{v}_1, \vec{v}_2$  with  $\lambda_1, \lambda_2$  for  $A$   
 If  $\lambda_1 \neq \lambda_2$  then  $\{\vec{v}_1, \vec{v}_2\}$  is linearly indep.

## Symmetric Matrices and their Eigenspaces

$$\text{Null}(A) = \text{Null}(A^T A)$$

### Theorem

$A$  is a symmetric matrix, with eigenvectors  $\vec{v}_1$  and  $\vec{v}_2$  corresponding to two distinct eigenvalues. Then  $\vec{v}_1$  and  $\vec{v}_2$  are orthogonal.

More generally, eigenspaces associated to distinct eigenvalues are orthogonal subspaces.

**Proof:**

$$\begin{cases} A v_1 = \lambda_1 v_1 \\ A v_2 = \lambda_2 v_2 \end{cases}$$

WANT :  $v_1 \cdot v_2 = 0$

$$\begin{aligned} \lambda_1 (v_1 \cdot v_2) &= (\lambda_1 v_1) \cdot v_2 = (A v_1) \cdot v_2 \\ &= (A v_1)^T \cdot v_2 = v_1^T \cdot A^T v_2 \\ &= v_1^T \cdot (A v_2) = \lambda_2 (v_1 \cdot v_2) \end{aligned}$$

$$\underbrace{(\lambda_1 - \lambda_2)}_{\neq 0} \underbrace{(v_1 \cdot v_2)} = 0 \Rightarrow v_1 \cdot v_2 = 0$$

$$A^T \cdot A = I \quad + \quad A \in \mathbb{R}^{n \times n}$$

Def  $A$  is orthogonal if

or  $\angle$  Columns of  $A$  are orthonormal and square.

# Example 1

Diagonalize  $A$  using an orthogonal matrix. Eigenvalues of  $A$  are given.

$$A = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}, \quad \lambda = -1, 1$$

*Hint: Gram-Schmidt*

WANT

$$A = \underset{\substack{\uparrow \\ \text{orthogonal}}}{P} \cdot \underset{\substack{\downarrow \\ \text{diagonal}}}{D} \cdot P^{-1} = \underbrace{P \cdot D \cdot P^T}$$

$$\lambda = 1 : \quad E_1 = \text{Null}(A - I) = \text{Null} \begin{pmatrix} -1 & 0 & 1 \\ 0 & 0 & 0 \\ 1 & 0 & -1 \end{pmatrix}$$

$$-x_1 + x_3 = 0 \quad \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} x_3 \\ x_2 \\ x_3 \end{bmatrix} = x_2 \underbrace{\begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}}_{v_1} + x_3 \underbrace{\begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}}_{v_2}$$

Section 7.1      Slide 6

$$\lambda = -1: \quad E_{-1} = \text{Null}(A + I) = \text{Null} \begin{pmatrix} 1 & 0 & 1 \\ 0 & 2 & 0 \\ 1 & 0 & 1 \end{pmatrix}$$

$$\begin{aligned} x_1 + x_3 &= 0 \\ x_2 &= 0 \end{aligned} \quad \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} -x_3 \\ 0 \\ x_3 \end{bmatrix} = x_3 \cdot \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} = \sqrt{3}$$

$\{v_1, v_2, v_3\}$  eigenvectors & basis for  $\mathbb{R}^3$   
 $\Rightarrow A$  is diagonalizable.

$$\begin{aligned}
 & \begin{matrix} \text{"} & \text{"} & \text{"} \\ \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} & \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} & \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} \end{matrix}
 \end{aligned}$$

$\Rightarrow$

$$\begin{aligned}
 & \{u_1, u_2, u_3\} \\
 & \begin{matrix} \text{"} & \text{"} & \text{"} \\ \frac{1}{1} \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} & \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} & \frac{1}{\sqrt{2}} \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} \end{matrix}
 \end{aligned}$$

eigenvector  
 orthonormal basis

$$A = \begin{bmatrix} u_1 & u_2 & u_3 \end{bmatrix} \overset{\text{"P"}}{\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & -1 \end{bmatrix}} \overset{\text{"D"}}{\cdot} \overset{\text{"P}^T}{P^{-1}}$$

$$= \begin{bmatrix} 0 & \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} \\ 1 & 0 & 0 \\ 0 & \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & -1 \end{bmatrix} \begin{bmatrix} 0 & 1 & 0 \\ \frac{1}{\sqrt{2}} & 0 & \frac{1}{\sqrt{2}} \\ -\frac{1}{\sqrt{2}} & 0 & \frac{1}{\sqrt{2}} \end{bmatrix}$$

$$= P \cdot D \cdot P^{-1}$$

# Spectral Theorem

**Recall:** If  $P$  is an orthogonal  $n \times n$  matrix, then  $P^{-1} = P^T$ , which implies  $A = PDP^T$  is diagonalizable and symmetric.  $A \sim \text{real}$

## Theorem: Spectral Theorem

An  $n \times n$  symmetric matrix  $A$  has the following properties.

1. All eigenvalues of  $A$  are real.
2. The dimension of each eigenspace is full, that it's dimension is **equal to** it's algebraic multiplicity.
3. The eigenspaces are mutually orthogonal.
4.  $A$  can be diagonalized:  $A = PDP^T$ , where  $D$  is diagonal and  $P$  is orthogonal.

**Proof (if time permits):**

$$\textcircled{1} \quad \vec{v}_1, \vec{v}_2 \in \mathbb{C}^n$$

$$\vec{v}_1 \cdot \vec{v}_1 \geq 0$$

Section 7.1 Slide 7

$$\vec{v}_1 \cdot \vec{v}_2 = \overline{\vec{v}_1^T} \cdot \vec{v}_2$$

$$\begin{bmatrix} 1 \\ 2i \end{bmatrix} \cdot \begin{bmatrix} 1 \\ 2i \end{bmatrix} = 1.1 + (-2i) \cdot (2i) = 5$$

$\lambda$  : eigenvalue for  $A$  with  $\vec{v}$

$$\begin{aligned} \lambda \cdot (\vec{v} \cdot \vec{v}) &= (\lambda \vec{v}) \cdot \vec{v} = (A\vec{v}) \cdot \vec{v} = \overline{A \cdot \vec{v}} \cdot \vec{v} > 0 \\ &= \overline{(A\vec{v})^T} \cdot \vec{v} = \overline{\vec{v}^T} \cdot \overline{A^T \cdot \vec{v}} \\ &= \overline{\vec{v}^T} \cdot (A\vec{v}) = \overline{\vec{v}^T} \cdot (\lambda \vec{v}) = \lambda \cdot (\vec{v} \cdot \vec{v}) \end{aligned}$$

$$\Rightarrow \lambda = \bar{\lambda}$$

$$\textcircled{2} \quad \lambda = \max \left\{ \underbrace{(Av) \cdot v} : v \in \mathbb{R}^n, \|v\|=1 \right\}$$

# Section 7.2 : Quadratic Forms

Chapter 7: Orthogonality and Least Squares

Math 1554 Linear Algebra

# Topics and Objectives

## Topics

1. Quadratic forms
2. Change of variables
3. Principle axes theorem
4. Classifying quadratic forms

## Learning Objectives

1. Characterize and classify quadratic forms using eigenvalues and eigenvectors.
2. Express quadratic forms in the form  $Q(\vec{x}) = \vec{x}^T A \vec{x}$ .
3. Apply the principle axes theorem to express quadratic forms with no cross-product terms.

**Motivating Question** Does this inequality hold for all  $x, y$ ?

$$x^2 - 6xy + 9y^2 \geq 0$$

# Quadratic Forms

let  $A$  be  $n \times n$  symmetric.

## Definition

A **quadratic form** is a **function**  $Q : \mathbb{R}^n \rightarrow \mathbb{R}$ , given by

$$Q(\vec{x}) = \vec{x}^T A \vec{x} = \begin{bmatrix} x_1 & x_2 & \cdots & x_n \end{bmatrix} \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{12} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{1n} & a_{2n} & \cdots & a_{nn} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \cdots \\ x_n \end{bmatrix}$$

$\downarrow \quad \downarrow \quad \downarrow$   
 $n \times n \quad n \times n \quad n \times 1$   
 $\vec{x}^T \quad A \quad \vec{x}$   
 $\vec{x} \cdot (A\vec{x})$

Matrix  $A$  is  $n \times n$  and symmetric.

In the above,  $\vec{x}$  is a vector of variables.

## Example 1

Compute the quadratic form  $\vec{x}^T A \vec{x}$  for the matrices below.

$$A = \begin{bmatrix} 4 & 0 \\ 0 & 3 \end{bmatrix}, \quad B = \begin{bmatrix} 4 & 1 \\ 1 & -3 \end{bmatrix}$$

$$\begin{aligned} Q_A(\vec{x}) &= \vec{x}^T \cdot A \cdot \vec{x} = \begin{bmatrix} x_1 & x_2 \end{bmatrix} \begin{bmatrix} 4 & 0 \\ 0 & 3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \\ &= \begin{bmatrix} 4x_1 & 3x_2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = 4x_1^2 + 3x_2^2 + 0 \cdot x_1 \cdot x_2 \end{aligned}$$

$$\begin{aligned} Q_B(\vec{x}) &= \vec{x}^T \cdot B \cdot \vec{x} = \begin{bmatrix} x_1 & x_2 \end{bmatrix} \begin{bmatrix} 4 & 1 \\ 1 & -3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \\ &= \begin{bmatrix} 4x_1 + x_2 & x_1 - 3x_2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \\ &= (4x_1 + x_2) \cdot x_1 + (x_1 - 3x_2) \cdot x_2 \\ &= 4x_1^2 + x_1x_2 + x_1x_2 - 3x_2^2 \\ &= 4x_1^2 + 2x_1x_2 - 3x_2^2 \end{aligned}$$

## Example 1 - Surface Plots

The surfaces for Example 1 are shown below.

$$y = 4x_1^2 + 3x_2^2$$

$$y = 4x_1^2 + 2x_1x_2 - 3x_2^2$$

*Students are not expected to be able to sketch quadratic surfaces, but it is helpful to see what they look like.*

$$\left\{ \begin{array}{l} A : \text{symm.} \Rightarrow Q_A(x) = x^T \cdot A \cdot x \\ Q : \text{Quadratic form} \Rightarrow \text{Find } \underline{A} : \text{symm.} \end{array} \right.$$

## Example 2

Write  $Q$  in the form  $\vec{x}^T A \vec{x}$  for  $\vec{x} \in \mathbb{R}^3$ .

$$Q(x) = 5x_1^2 - x_2^2 + 3x_3^2 + 6x_1x_3 - 12x_2x_3$$

$$= \begin{bmatrix} x_1 & x_2 & x_3 \end{bmatrix} \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$$

$$= \begin{bmatrix} x_1 \cdot a_{11} + x_2 \cdot a_{21} + x_3 \cdot a_{31} & x_1 \cdot a_{12} + x_2 \cdot a_{22} + x_3 \cdot a_{32} & x_1 \cdot a_{13} + x_2 \cdot a_{23} + x_3 \cdot a_{33} \end{bmatrix} \cdot \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$$

$$= x_1 \cdot a_{11} \cdot x_1 + x_2 \cdot a_{21} \cdot x_1 + x_3 \cdot a_{31} \cdot x_1 + x_1 \cdot a_{12} \cdot x_2 + x_2 \cdot a_{22} \cdot x_2 + x_3 \cdot a_{32} \cdot x_2 + x_1 \cdot a_{13} \cdot x_3 + x_2 \cdot a_{23} \cdot x_3 + x_3 \cdot a_{33} \cdot x_3$$

$$= \underbrace{a_{11}}_5 x_1^2 + \underbrace{a_{22}}_{-1} x_2^2 + \underbrace{a_{33}}_3 x_3^2 + \underbrace{2a_{12}}_0 x_1 x_2 + \underbrace{2a_{23}}_{-6} x_2 x_3 + \underbrace{2a_{31}}_3 x_3 x_1$$

Section 7.2 Slide 13

$$\Rightarrow A = \begin{bmatrix} 5 & 0 & 3 \\ 0 & -1 & -6 \\ 3 & -6 & 3 \end{bmatrix}$$

$P$  :  $n \times n$  <sup>invertible</sup> matrix

$$\vec{x} \rightsquigarrow \vec{y} = \begin{bmatrix} y_1 \\ \vdots \\ y_n \end{bmatrix} = P^{-1} \cdot \vec{y}$$

$$\vec{x} = P \cdot \vec{y}$$

## Change of Variable

If  $\vec{x}$  is a variable vector in  $\mathbb{R}^n$ , then a **change of variable** can be represented as

$$\vec{x} = P\vec{y}, \quad \text{or} \quad \vec{y} = P^{-1}\vec{x}$$

With this change of variable, the quadratic form  $\vec{x}^T A \vec{x}$  becomes:

Ex  $P = \frac{1}{\sqrt{5}} \begin{bmatrix} 1 & -2 \\ 2 & 1 \end{bmatrix}$  <sup>orthogonal</sup>  $\vec{x} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$

$$P^{-1} = P^T = \frac{1}{\sqrt{5}} \begin{bmatrix} 1 & 2 \\ -2 & 1 \end{bmatrix}$$

$$\begin{bmatrix} y_1 \\ y_2 \end{bmatrix} = \vec{y} = P^{-1} \cdot \vec{x} = \frac{1}{\sqrt{5}} \begin{bmatrix} 1 & 2 \\ -2 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \frac{1}{\sqrt{5}} \begin{bmatrix} x_1 + 2x_2 \\ -2x_1 + x_2 \end{bmatrix}$$

Ex  $Q(\vec{x}) = \underbrace{x_1^2 - 6x_1x_2 + 10x_2^2}$

$$= \underbrace{(x_1^2 - 6x_1x_2 + 9x_2^2)} + x_2^2$$

$$= 1 \cdot \underbrace{(x_1 - 3x_2)^2}_{y_1} + 1 \cdot \underbrace{(x_2)^2}_{y_2} \geq 0$$

## Example 3

Make a change of variable  $\vec{x} = P\vec{y}$  that transforms  $Q = \vec{x}^T A \vec{x}$  so that it does not have cross terms. The orthogonal decomposition of  $A$  is given.

$$\vec{y} = \frac{1}{\sqrt{5}} \begin{bmatrix} 2 & -1 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \quad A = \begin{pmatrix} 3 & 2 \\ 2 & 6 \end{pmatrix} \xrightarrow{\text{symm.}} \underbrace{PDP^T} \quad \begin{array}{l} P: \text{orthogonal} \\ D: \text{diagonal} \end{array}$$

$$= \frac{1}{\sqrt{5}} \begin{bmatrix} 2x_1 - x_2 \\ x_1 + 2x_2 \end{bmatrix} \quad \left\{ \begin{array}{l} P = \frac{1}{\sqrt{5}} \begin{pmatrix} 2 & 1 \\ -1 & 2 \end{pmatrix} \\ D = \begin{pmatrix} 2 & 0 \\ 0 & 7 \end{pmatrix} \end{array} \right. \quad P^T = \frac{1}{\sqrt{5}} \begin{bmatrix} 2 & -1 \\ 1 & 2 \end{bmatrix}$$

$$3x_1^2 + 4x_1x_2 + 6x_2^2$$

$$Q_A(\vec{x}) = \vec{x}^T \cdot A \cdot \vec{x} = \underbrace{(\vec{x}^T \cdot P)}_{(\vec{y}^T \cdot \vec{x})^T} \cdot D \cdot \underbrace{(P^T \cdot \vec{x})}_{\vec{y}}$$

$$= \vec{y}^T \cdot D \cdot \vec{y} = Q_D(\vec{y})$$

$$= \begin{bmatrix} y_1 & y_2 \end{bmatrix} \begin{bmatrix} 2 & 0 \\ 0 & 7 \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix} = \underline{2 \cdot y_1^2 + 7 \cdot y_2^2}$$

$$= 2 \left( \frac{1}{\sqrt{5}} (2x_1 - x_2) \right)^2 + 7 \left( \frac{1}{\sqrt{5}} (x_1 + 2x_2) \right)^2 \geq 0$$

## Geometry

Suppose  $Q(\vec{x}) = \vec{x}^T A \vec{x}$ , where  $A \in \mathbb{R}^{n \times n}$  is symmetric. Then the set of  $\vec{x}$  that satisfies

$$C = \vec{x}^T A \vec{x}$$

defines a curve or surface in  $\mathbb{R}^n$ .

## Principle Axes Theorem

$$A = P \cdot D \cdot P^T.$$

### Theorem

If  $A$  is a symm. matrix then there exists an orthogonal change of variable  $\vec{x} = P\vec{y}$  that transforms  $\vec{x}^T A \vec{x}$  to  $\vec{y}^T D \vec{y}$  with no cross-product terms.

**Proof (if time permits):**

## Example 5

Compute the quadratic form  $Q = \vec{x}^T A \vec{x}$  for  $A = \begin{pmatrix} 5 & 2 \\ 2 & 8 \end{pmatrix}$ , and find a change of variable that removes the cross-product term. A sketch of  $Q$  is below.

$$\textcircled{1} \quad \det(A - \lambda I) = \lambda^2 - (5+8)\lambda + (5 \cdot 8 - 2^2) \\ = \lambda^2 - 13\lambda + 36 = (\lambda - 4)(\lambda - 9) = 0$$

$$\textcircled{2} \quad E_4 = \text{Null}(A - 4I) = \text{Null}\left(\begin{pmatrix} 1 & 2 \\ 2 & 4 \end{pmatrix}\right) = \text{Span}\left\{\frac{1}{\sqrt{5}} \begin{bmatrix} 2 \\ -1 \end{bmatrix}\right\}$$

$$E_9 = \text{Null}(A - 9I) = \text{Null}\left(\begin{pmatrix} -4 & 2 \\ 2 & -1 \end{pmatrix}\right) = \text{Span}\left\{\frac{1}{\sqrt{5}} \begin{bmatrix} 1 \\ 2 \end{bmatrix}\right\}$$

Section 7.2 Slide 18

$$\Rightarrow D = \begin{bmatrix} 4 & 0 \\ 0 & 9 \end{bmatrix} \quad P = \frac{1}{\sqrt{5}} \begin{bmatrix} 2 & 1 \\ -1 & 2 \end{bmatrix}.$$

$$Q_A(\vec{x}) = 5x_1^2 + 4x_1x_2 + 8x_2^2 = 4y_1^2 + 9y_2^2 \\ \vec{y} = P^T \cdot \vec{x}.$$

## Classifying Quadratic Forms

$$Q = x_1^2 + x_2^2$$

$$Q = -x_1^2 - x_2^2$$

### Definition

A quadratic form  $Q$  is

1. **positive definite** if  $Q(x) > 0$  for all  $\vec{x} \neq \vec{0}$ .
2. **negative definite** if  $Q(x) < 0$  for all  $\vec{x} \neq \vec{0}$ .
3. **positive semidefinite** if  $Q(x) \geq 0$  for all  $\vec{x}$ .
4. **negative semidefinite** if  $Q(x) \leq 0$  for all  $\vec{x}$ .
5. **indefinite** if otherwise

Positive definite  $\Leftrightarrow Q_A(x) > 0$

## Quadratic Forms and Eigenvalues

$$Q_D(\vec{y}) = \lambda_1 y_1^2 + \lambda_2 y_2^2 + \dots$$

### Theorem

If  $A$  is a symm. matrix with eigenvalues  $\lambda_i$ ,  
then  $Q = \vec{x}^T A \vec{x}$  is

1. **positive definite** iff  $\lambda_i > 0$
2. **negative definite** iff  $\lambda_i < 0$
3. **indefinite** iff  $\lambda_i \begin{matrix} > \\ < \end{matrix} 0$

**Proof (if time permits):**

## Example 6

We can now return to our motivating question (from first slide): does this inequality hold for all  $x, y$ ?

$$x^2 - 6xy + 9y^2 \geq 0$$

# Section 7.3 : Constrained Optimization

Chapter 7: Orthogonality and Least Squares

Math 1554 Linear Algebra

# Topics and Objectives

## Topics

1. Constrained optimization as an eigenvalue problem
2. Distance and orthogonality constraints

## Learning Objectives

1. Apply eigenvalues and eigenvectors to solve optimization problems that are subject to distance and orthogonality constraints.

## Example 1

The surface of a unit sphere in  $\mathbb{R}^3$  is given by

$$1 = x_1^2 + x_2^2 + x_3^2 = \|\vec{x}\|^2$$

$Q$  is a quantity we want to optimize

$$Q(\vec{x}) = 9x_1^2 + 4x_2^2 + 3x_3^2$$

Find the largest and smallest values of  $Q$  on the surface of the sphere.

## A Constrained Optimization Problem

Suppose we wish to find the maximum or minimum values of

$$Q(\vec{x}) = \vec{x}^T A \vec{x}$$

subject to

$$\|\vec{x}\| = 1$$

That is, we want to find

$$m = \min\{Q(\vec{x}) : \|\vec{x}\| = 1\}$$
$$M = \max\{Q(\vec{x}) : \|\vec{x}\| = 1\}$$

This is an example of a **constrained optimization** problem. Note that we may also want to know where these extreme values are obtained.

## Constrained Optimization and Eigenvalues

### Theorem

If  $Q = \vec{x}^T A \vec{x}$ ,  $A$  is a real  $n \times n$  symmetric matrix, with eigenvalues

$$\lambda_1 \geq \lambda_2 \geq \dots \geq \lambda_n$$

and associated normalized eigenvectors

$$\vec{u}_1, \vec{u}_2, \dots, \vec{u}_n$$

Then, subject to the constraint  $\|\vec{x}\| = 1$ ,

- the **maximum** value of  $Q(\vec{x}) = \lambda_1$ , attained at  $\vec{x} = \pm \vec{u}_1$ .
- the **minimum** value of  $Q(\vec{x}) = \lambda_n$ , attained at  $\vec{x} = \pm \vec{u}_n$ .

**Proof:**

## Example 2

Calculate the maximum and minimum values of  $Q(\vec{x}) = \vec{x}^T A \vec{x}$ ,  $\vec{x} \in \mathbb{R}^3$ , subject to  $\|\vec{x}\| = 1$ , and identify points where these values are obtained.

$$Q(\vec{x}) = x_1^2 + 2x_2x_3$$

## Example 2

The image below is the unit sphere whose surface is colored according to the quadratic from the previous example. Notice the agreement between our solution and the image.

## An Orthogonality Constraint

### Theorem

Suppose  $Q = \vec{x}^T A \vec{x}$ ,  $A$  is a real  $n \times n$  symmetric matrix, with eigenvalues

$$\lambda_1 \geq \lambda_2 \dots \geq \lambda_n$$

and associated eigenvectors

$$\vec{u}_1, \vec{u}_2, \dots, \vec{u}_n$$

Subject to the constraints  $\|\vec{x}\| = 1$  and  $\vec{x} \cdot \vec{u}_1 = 0$ ,

- The maximum value of  $Q(\vec{x}) = \lambda_2$ , attained at  $\vec{x} = \vec{u}_*$ .
- The minimum value of  $Q(\vec{x}) = \lambda_n$ , attained at  $\vec{x} = \vec{u}_n$ .

Note that  $\lambda_2$  is the second largest eigenvalue of  $A$ .

## Example 3

Calculate the maximum value of  $Q(\vec{x}) = \vec{x}^T A \vec{x}$ ,  $\vec{x} \in \mathbb{R}^3$ , subject to  $\|\vec{x}\| = 1$  and to  $\vec{x} \cdot \vec{u}_1 = 0$ , and identify a point where this maximum is obtained.

$$Q(\vec{x}) = x_1^2 + 2x_2x_3, \quad \vec{u}_1 = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}$$

## Example 4 (if time permits)

Calculate the maximum value of  $Q(\vec{x}) = \vec{x}^T A \vec{x}$ ,  $\vec{x} \in \mathbb{R}^3$ , subject to  $\|\vec{x}\| = 5$ , and identify a point where this maximum is obtained.

$$Q(\vec{x}) = x_1^2 + 2x_2x_3$$

# Section 7.4 : The Singular Value Decomposition

Chapter 7: Orthogonality and Least Squares

Math 1554 Linear Algebra

# Topics and Objectives

## Topics

1. The Singular Value Decomposition (SVD) and some of its applications.

## Learning Objectives

1. Compute the SVD for a rectangular matrix.
2. Apply the SVD to
  - ▶ estimate the rank and condition number of a matrix,
  - ▶ construct a basis for the four fundamental spaces of a matrix, and
  - ▶ construct a spectral decomposition of a matrix.

## Example 1

The linear transform whose standard matrix is

$$A = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & -1 \\ 1 & 1 \end{pmatrix} \begin{pmatrix} 2\sqrt{2} & 0 \\ 0 & \sqrt{2} \end{pmatrix} = \begin{pmatrix} 2 & -1 \\ 2 & 1 \end{pmatrix}$$

maps the unit circle in  $\mathbb{R}^2$  to an ellipse, as shown below. Identify the unit vector  $\vec{x}$  in which  $\|A\vec{x}\|$  is maximized and compute this length.

## Example 1 - Solution

## Singular Values

The matrix  $A^T A$  is always symmetric, with non-negative eigenvalues  $\lambda_1 \geq \lambda_2 \geq \cdots \geq \lambda_n \geq 0$ . Let  $\{\vec{v}_1, \dots, \vec{v}_n\}$  be the associated orthonormal eigenvectors. Then

$$\|A\vec{v}_j\|^2 =$$

If the  $A$  has rank  $r$ , then  $\{A\vec{v}_1, \dots, A\vec{v}_r\}$  is an orthogonal basis for  $\text{Col}A$ :  
For  $1 \leq j < k \leq r$ :

$$(A\vec{v}_j)^T A\vec{v}_k =$$

**Definition:**  $\sigma_1 = \sqrt{\lambda_1} \geq \sigma_2 = \sqrt{\lambda_2} \cdots \geq \sigma_n = \sqrt{\lambda_n}$  are the singular values of  $A$ .

# The SVD

## Theorem: Singular Value Decomposition

A  $m \times n$  matrix with rank  $r$  and non-zero singular values  $\sigma_1 \geq \sigma_2 \geq \dots \geq \sigma_r$  has a decomposition  $U\Sigma V^T$  where

$$\Sigma = \begin{bmatrix} D & 0 \\ 0 & 0 \end{bmatrix}_{m \times n} = \begin{bmatrix} \sigma_1 & 0 & \dots & 0 \\ 0 & \sigma_2 & \dots & \vdots & \mathbf{0} \\ \vdots & \vdots & \ddots & & \\ 0 & 0 & \dots & \sigma_r \\ & \mathbf{0} & & & \mathbf{0} \end{bmatrix}$$

$U$  is a  $m \times m$  orthogonal matrix, and  $V$  is a  $n \times n$  orthogonal matrix.

$$M = U \cdot \Sigma \cdot V^*$$

---

## Algorithm to find the SVD of $A$

Suppose  $A$  is  $m \times n$  and has rank  $r \leq n$ .

1. Compute the squared singular values of  $A^T A$ ,  $\sigma_i^2$ , and construct  $\Sigma$ .
2. Compute the unit singular vectors of  $A^T A$ ,  $\vec{v}_i$ , use them to form  $V$ .
3. Compute an orthonormal basis for  $\text{Col}A$  using

$$\vec{u}_i = \frac{1}{\sigma_i} A \vec{v}_i, \quad i = 1, 2, \dots, r$$

Extend the set  $\{\vec{u}_i\}$  to form an orthonormal basis for  $\mathbb{R}^m$ , use the basis to form  $U$ .

**Example 2:** Write down the singular value decomposition for

$$\begin{bmatrix} 2 & 0 \\ 0 & -3 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} =$$

**Example 3:** Construct the singular value decomposition of

$$A = \begin{bmatrix} 1 & -1 \\ -2 & 2 \\ 2 & -2 \end{bmatrix}.$$

(It has rank 1.)

## Applications of the SVD

The SVD has been applied to many modern applications in CS, engineering, and mathematics (our textbook mentions the first four).

- Estimating the rank and condition number of a matrix
- Constructing bases for the four fundamental spaces
- Computing the pseudoinverse of a matrix
- Linear least squares problems
- Non-linear least-squares  
[https://en.wikipedia.org/wiki/Non-linear\\_least\\_squares](https://en.wikipedia.org/wiki/Non-linear_least_squares)
- Machine learning and data mining  
<https://en.wikipedia.org/wiki/K-SVD>
- Facial recognition  
<https://en.wikipedia.org/wiki/Eigenface>
- Principle component analysis  
[https://en.wikipedia.org/wiki/Principal\\_component\\_analysis](https://en.wikipedia.org/wiki/Principal_component_analysis)
- Image compression

*Students are expected to be familiar with the 1<sup>st</sup> two items in the list.*

## The Condition Number of a Matrix

If  $A$  is an invertible  $n \times n$  matrix, the ratio

$$\frac{\sigma_1}{\sigma_n}$$

is the **condition number** of  $A$ .

Note that:

- The condition number of a matrix describes the sensitivity of a solution to  $A\vec{x} = \vec{b}$  is to errors in  $A$ .
- We could define the condition number for a rectangular matrix, but that would go beyond the scope of this course.

## Example 4

For  $A = U\Sigma V^*$ , determine the rank of  $A$ , and orthonormal bases for  $\text{Null}A$  and  $(\text{Col}A)^\perp$ .

$$U = \begin{bmatrix} 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & -1 \\ 1 & 0 & 0 & 0 \end{bmatrix}$$

$$\Sigma = \begin{bmatrix} 4 & 0 & 0 & 0 & 0 \\ 0 & 3 & 0 & 0 & 0 \\ 0 & 0 & \sqrt{5} & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

$$V^* = \begin{bmatrix} 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ \sqrt{0.2} & 0 & 0 & 0 & \sqrt{0.8} \\ 0 & 0 & 0 & 1 & 0 \\ -\sqrt{0.8} & 0 & 0 & 0 & \sqrt{0.2} \end{bmatrix}$$

## Example 4 - Solution

# The Four Fundamental Spaces

**FIGURE 4** The four fundamental subspaces and the action of  $A$ .

1.  $A\vec{v}_s = \sigma_s \vec{u}_s$ .
2.  $\vec{v}_1, \dots, \vec{v}_r$  is an orthonormal basis for  $\text{Row } A$ .
3.  $\vec{u}_1, \dots, \vec{u}_r$  is an orthonormal basis for  $\text{Col } A$ .
4.  $\vec{v}_{r+1}, \dots, \vec{v}_n$  is an orthonormal basis for  $\text{Null } A$ .
5.  $\vec{u}_{r+1}, \dots, \vec{u}_n$  is an orthonormal basis for  $\text{Null } A^T$ .

## The Spectral Decomposition of a Matrix

The SVD can also be used to construct the spectral decomposition for any matrix with rank  $r$

$$A = \sum_{s=1}^r \sigma_s \vec{u}_s \vec{v}_s^T,$$

where  $\vec{u}_s, \vec{v}_s$  are the  $s^{th}$  columns of  $U$  and  $V$  respectively.

For the case when  $A = A^T$ , we obtain the same spectral decomposition that we encountered in Section 7.2.
